1
DESIGN
Scope · Anchor
Write the safety card before choosing a model. Ground every health claim in approved, versioned evidence.
2
BUILD
Fence · Contextualize · Act · Route
Layer the guardrails, govern every tool, and make escalation deterministic.
3
EVALUATE
Evaluate
Run the ablation ladder on held-out scenarios. Qualify the instrument first: noise floor, clinician band, judge distance.
4
RELEASE
Gate
Any critical miss blocks release. Every other gate is read against a confidence bound, never a point score.
5
OPERATE
Evidence
Monitor the running agent and confirm it is the approved one. Every incident becomes a new test.
Any change to model, prompt, sources or tools re-enters at Evaluate
